26-MAY-2000;
30-JUN-2000;
          (a) algorithmically predicting at least one exon from genomic sequences of the eukaryote; and (b) detecting specific hybridisation of detectably labeled nucleic acids from eukaryote lung mRNA, to a single exon probe, having a fragment identical to the predicted exon, the probe is included in the above mentioned microarray; assigning exons to a single gene, comprising (a) identifying exons from genomic sequence by the method above and (b) measuring the expression of each of the exons in several tissues and/or cell types using hybridisation to a single exon microarrays having a probe with the exon, where a common pattern of expression of the exons in the tissues and/or cell types indicates that
                                                                                                                                                                                                     The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human lung comprising single exon nucleic acid probes having one of 12614 nucleic acid sequences mentioned in the specification, or their complements or the 12387 open reading frames derived from the 12614 probes. Also included are a microarray comprising the novel set of probes; the novel set of probes which hybridise at high stringency to a nucleic acid expressed in the human lung; measuring gene expression in a sample derived from human lung, comprising (a) contacting the array with a collection of detectably labeled nucleic acids derived from human lung mRNA, and (b) measuring the label detectably bound to each probe of the array; identifying exons in a enkaryotic genome, comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             chronic obstructive pulmonary disease; interstitial lung dis familial idiopathic pulmonary fibrosis; neurofibromatosis; tuberous sclerosis; Gaucher's disease; Niemann-Pick disease;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ABG41659 standard; Peptide; 153

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          pulmonary alveolar proteinosis, Karagener syndrome, fibrocystic pulmonary dysplasia, primary ciliary dyskinesis, pulmonary hypertension and hyaline membrane disease. The present sequence is a peptide/protein encoded by a single exon probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           probes/open reading frames (ORF). The probes are used for gene probes/open reading frames (ORF). The probes are used for gene particularly using human lung derived mRNA and for the study of lung diseases such as asthma, lung cancer, chronic obstructive pulmonary disease (COPD), interstitial lung disease (ILD), familial idiopathic pulmonary fibrosis, neurofibromatosis, tuberous sclerosis, Gaucher's disease, Niemann-Pick disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary Niemann-Pick disease, Hermansky-Pudlak syndrome, sarcoidosis, pulmonary

The present invention relates to human single exon nucleic acid probes (SENP: see AAI10068-AAI28459). The present sequence is a peptide encoded by one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                probes which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of cancer such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAM19335 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human genome-derived single exon nucleic acid probes useful analyzing gene expression in human bone {\tt marrow} -

                                                                                                                                                                                                                                                                                                                                                          The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA21355-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; gene expression; heart; microarray; vascular system; cardiovascular disease; hypertension; cardiac arrhythmia; congenital heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Single

                                                                                                                                                                                                                                                                                                                                                                                                                                         probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system diseases such as Alzheimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               27-SEP-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁
Protein #5745 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                              The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    04-FEB-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           AABO8324-36 represent epitopes derived from a Chlamydia pneumoniae protein. The protein, immunogenic fragments of it, nucleotide sequences encoding it, or inhibitor specific against it are used to manufacturing a medicament for the treatment of infection due to C. pneumoniae. An antibody specific against the protein can diagnose a C. pneumoniae infection. C. pneumoniae infection can be prevented. Artherosclerosis, including coronary atherosclerosis, caused by C. pneumoniae can also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 5; Page 34; 35pp; English.

The mature Clahil allergen has mol. wt. 11 kD and is encoded by cDNA sequence AAQ87846. The allergen has homology to the ribosomal protein RLA2. Potential epitopic subfragments were identified by computer analysis of the amino acid sequence. See AAR72670-R72674 for potential B-cell epitopes and AAR72675-R72677 for potential T-cell epitopes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Protein identification; signal transduction pathway; metabolic pathway; hybridisation assay; genetic mapping; gene expression control; promoter;

                                                                                                                                                                 AAB08324-36 represent epitopes derived from a Chlamydia pneumoniae protein. The protein, immunogenic fragments of it, nucleotide sequences encoding it, or inhibitor specific against it are used to manufacturing a medicament for the treatment of infection due to C. pneumoniae. An antibody specific against the protein can diagnose a C. pneumoniae infection. C. pneumoniae infection can be prevented. Artherosclerosis, including coronary atherosclerosis, caused by C. pneumoniae can also

                                                                                                                                                                                                                                                                                                                                                  AAB08324-36 represent epitopes derived from a Chlamydia pneumoniae protein. The protein, immunogenic fragments of it, nucleotide sequences encoding it, or inhibitor specific against it are used to manufacturing a medicament for the treatment of infection due to C. pneumoniae. An antibody specific against the protein can diagnose a C. pneumoniae infection. C. pneumoniae infection can be prevented. Artherosclerosis, including coronary atherosclerosis, caused by C. pneumoniae can also

The polypeptides may be used as antigens in the production of antibodies specific for P. acnes proteins. These antibodies can be used to downregulate expression and activity of P. acnes polypeptides and therefore treat P. acnes infections. The antibodies may also be used as diagnostic agents for determining P. acnes presence, for example, by enzyme linked immunosorbent assay (ELISA).

Note: The sequence data for this patent did not form part of the printed as pecification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Propionibacterium acnes polypeptides and nucleic acids useful for vaccinating against and diagnosing infections, especially useful treating acne vulgaris -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pustulosis, hypertosis and osteomyelitis), uveitis and endophthalmitis. P. acnes is also involved in infections of bone, joints and the central nervous system, however it is particularly involved in the inflammatory lesions associated with acne vulgaris. A method for detecting the

                       AAB08324-36 represent epitopes derived from a Chlamydia pneumoniae protein. The protein, immunogenic fragments of it, nucleotide sequences encoding it, or inhibitor specific against it are used to manufacturing a medicament for the treatment of infection due to C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    An antibody specific against the protein can diagnose a C. pneumoniae infection. C. pneumoniae infection can be prevented. Artherosclerosis, including coronary atherosclerosis, caused by C. pneumoniae can also be prevented or treated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AABO8324-36 represent epitopes derived from a Chlamydia pneumoniae protein. The protein, immunogenic fragments of it, nucleotide sequences encoding it, or inhibitor specific against it are used to manufacturing a medicament for the treatment of infection due to C. pneumoniae.

                                                                                                                                                                                                                                                                                                                                                                                                                      QΥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Creceptor/ligand, antihinflammatory activity, tumour inhibition activity, can and antihinfective activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. OREX proteins, concluded and antibodies may be used in the treatment of cancers, concluded activity disorders such as psoriasis and benign tumours, conterproliferative disorders such as psoriasis and benign tumours, concluded a disorders such as partial and benign tumours, concluded a disorders such as epilepsy and Alzhelmer's disease, concluded a disorders of tissue growth and regeneration, concluded a disorders of tissue growth and regeneration, concluded a disorders of tissue growth and regeneration, concluded a diseases such as diabetes mellitus, hypothyroidism, and cholesterol ester storage disease, and infectious diseases caused by viral, bacterial, concluded a dispersion of the pathogens. ORFX nucleic acids may also be used as a concrete of primers and probes, in the detection of ORFX genomic sequences cor transcripts, in the identification and cloning of homologous concluded acids may additionally be used to produce transgenic animals concluded a dispersion of the produce transgenic animals concluded as a concluded animal of the dispersion of the ore activity of ORFX concluded animals and concluded animals are useful in the dismunogens to generate specific antibodies, which are useful in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                    interactions of invasive carcinogens with surrounding tissues - by usi anti-gamma-2 chain antibodies to inhibit the gamma-2 chain biological activity of the invasive carcinogens. The invention also comprises a method for promoting adhesion of epithelial cells by exposing the cell to intact laminin-5 molecules. The first method of the invention is useful for preventing gamma 2 chain interactions of invasive carcinoge with surrounding tissues. The second method of the invention is useful

The protein, immunogenic fragments of it, nucleotide sequences encoding it, or inhibitor specific against it are used to manufacturing a medicament for the treatment of infection due to C. pneumoniae. An antibody specific against the protein can diagnose a C. pneumoniae infection. C. pneumoniae infection can be prevented. Artherosclerosis, including coronary atherosclerosis, caused by C. pneumoniae can also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLJ6176-ABLJ6511), expressed DNA sequences (ABLO1840-ABLJ6175) and the encoded proteins (ABB57737-ABB72072).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions - \,
                                                                                                                                                                                                                hypothyroidism; cholesterol ester storage disease; infection; vasotropic; antipsoriatic; antidiabetic; cytostatic; nootropi
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The sequence data for this patent did not form specification, but was obtained in electronic fat ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                    The present sequence is the dihydrofolate reductase (DHFR)/
C. pneumoniae polypeptide antigen variant fusion protein.
C. pneumoniae strain YK41 was cultured and genomic DNA extracted
to prep. a lambda gt11 DNA library. The library was then screened
with an anti-YK41 monoclonal antibody (MAb), which was prepd. by
fusing spleen cells from a mouse infected with YK41 with myeloma
p3/NS1/1-Ag4 1 to produce a MAb expressing hydridoma. The DNA
cobtd. was then fused with DHFR DNA and the expression vector
pADA431 to give pCPN53T. The plasmid was used to transform an
E. coli host, which was cultured to give an antigenic polypeptide
fusion protein. The fusion protein and primers and probes derived
contist DNA can be used in assays for the detection of the
antigenic polypeptide antibodies and DNA, respectively, useful in
the diagnosis of C. pneumoniae infection.

                                                                                                                           AABO8324-36 represent epitopes derived from a Chlamydia pneumoniae protein. The protein, immunogenic fragments of it, nucleotide sequences encoding it, or inhibitor specific against it are used to manufacturing a medicament for the treatment of infection due to C. pneumoniae. An antibody specific against the protein can diagnose a C. pneumoniae infection. C. pneumoniae infection can be prevented. Artherosclerosis, including coronary atherosclerosis, caused by C. pneumoniae can also
                                                                                                                                                                                                                          Claim

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             polypeptide antigen, polypeptide A. C. pneumoniae strain YK41 was cultured and genomic DNA extracted to prep. a lambda gtll DNA library. The library was then screened with an anti-YK41 monoclonal antibody (MAD), which was prepd. by fusing spleen cells from a mouse infected with YK41 with myeloma PJNS1/1-Ag4-1 to produce a MAD expressing hydridoma. The DNA obtd. was then fused with the expression vector pADA431 to give pCPNS33alpha. The plasmid was used to transform an E. coli host, which was cultured to give the antigenic polypeptide, polypeptide A. Polypeptide A and primers and probes derived from its DNA can be used in assays for the detection of polypeptide A antibodies and DNA, respectively, useful in the diagnosis of C. pneumoniae infection.
 Amino acid sequence of a Chlamydia pneumoniae His-tagged protein.

The protein, immunogenic fragments of it, nucleotide sequences encoding it, or inhibitor specific against it are used to manufacturing a medicament for the treatment of infection due to C. pneumoniae. An antibody specific against the protein can diagnose a C. pneumoniae infection. C. pneumoniae infection can be prevented. Artherosclerosis, including coronary atherosclerosis, caused by C. pneumoniae can also be prevented or treated.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New Chlamydia pneumoniae protein of 496 amino acids preventing and treating C. pneumoniae infection and including coronary atherosclerosis -

C. pneumoniae strain YK41 was C cultured and genomic DNA extracted to prep. a lambda gtll DNA it cultured and genomic DNA extracted to prep. a lambda gtll DNA it cultured and genomic DNA extracted to prep. a lambda gtll DNA it cultured and genomic DNA extracted with an anti-YK41 monoclonal antibody (MAb), which was prepd. by fusing spleen cells from a mouse infected with YK41 with myeloma P3/NSI/1-Ay4-1 to produce a MAb expressing hydridoma. The DNA obtd. was then fused with the expression vector pADA431 to give pCPN533alpha. The plasmid was used to transform an E. coli host, which was cultured to give the antigenic polypeptide, polypeptide A. Polypeptide A and primers and probes derived from its DNA can be used in assays for the detection of polypeptide A antibodies and DNA, respectively, useful in the diagnosis of C. pneumoniae infection.
                 C. pneumoniae 53 kDa

C. pneumoniae strain YK41 was cultured and genomic DNA extracted to prep. a lambda gtll DNA library. The library was then screened with an anti-YK41 monoclonal antibody (MAb), which was prepd. by fusing spleen cells from a mouse infected with YK41 with myeloma P3/NS1/1-Ag4-1 to produce a MAb expressing hydridoma. The DNA obtd. was then fused with the expression vector pADA431 to give pCPN533alpha. The plasmid was used to transform an E. coli host, which was cultured to give the antigenic polypeptide, polypeptide A. molypeptide A and primers and probes derived from its DNA can be used in assays for the detection of polypeptide A antibodies and DNA, respectively, useful in the diagnosis of antibodies and DNA, respectively, useful in the diagnosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Recombinant Chlamydia used for detection and

Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        especially where the vector directs the expression epitope of C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Griffais

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Qy
                  p3/NSI/1-Ag4-1 to produce a MAb expressing hydridoma. The DNA obtd. was then fused with DHFR DNA and the expression vector pADA431 to give pCPNS33T. The plasmid was used to transform an E. coli host, which was cultured to give the antigenic polypeptide fusion protein, polypeptide B. Polypeptide B and primers and probes derived from its DNA can be used in assays for the detection of antigenic polypeptide antibodies and DNA, respectively, useful in the diagnosis of C. pneumoniae infection.
Sequence
                                                                                                                          C. pneumoniae polypeptide antigen fusion protein, polypeptide B. c. pneumoniae strain YK41 was cultured and genomic DNA extracted to prep. a lambda gtll DNA library. The library was then screened with an anti-YK41 monoclonal antibody (WAb), which was prepd. by fusing spleen cells from a mouse infected with YK41 with myeloma

The protein, immunogenic fragments of it, nucleotide sequences encoding it, or inhibitor specific against it are used to manufacturing a medicament for the treatment of infection due to C. pneumoniae. An antibody specific against the protein can diagnose a C. pneumoniae infection. C. pneumoniae infection can be prevented. Artherosclerosis, including coronary atherosclerosis, caused by C. pneumoniae can also
